

Environmental and energy policy

With the definition of our environmental and energy policy, we underline the importance of an environmental and energy management system to profine.

We commit ourselves by contract to a sustainable production through the optimal use of suitable resources. The greatest asset of our company are our employees, our customers and the environment.

Our environmental and energy management system accompanies our comprehensive attitude of sustainability which we put into practice with our energy-efficient window systems, lead-free stabilisers and intelligent recycling concepts.

It is our aim to preserve the energetic resources used by us. On the basis of the implementation and maintenance of an energy management system, we will significantly improve the efficiency of the energy used by means of a constant improvement process and the consideration of necessary technical innovations. All environmental pollution such as waste water, material consumption, waste and greenhouse emissions in addition to energy consumption are constantly checked by us and reduced to a minimum.

We are specially optimising our environmental and energy management system with regard to technical, organisational and process guidelines.

We want to become the most sustainable company in our industry along the entire value chain of our company, starting with the design of machines and raw materials, through to production and shipping to our customers.

Of course, we commit ourselves to observe all relevant legal and other guidelines.

We set the same standards concerning the working method and handling of resources for our partners and persons in our sphere of influence as well.

We inform all employees and the public about our environmental and energy policy. Furthermore, the responsibilities, resources and competences are clearly defined and specified by us.

We invest in the competence of our employees so that they can make an important contribution to achieve our aims. Environmental awareness is promoted at all company levels through training measures.

The systematic basis for our environmental and energy management system are the guidelines of ISO 50001 and ISO 14001. We determine our standards on the basis of these guidelines and we will observe them to the best of our knowledge and belief.
